Assignment 5

1. Let $\Omega \subset \mathbb{R}^n$ be a bounded domain with smooth boundary and prove *Poincaré's Inequality*

$$\|u\|_{L_p(\Omega)} \leq c\|\nabla u\|_{L_p(\Omega)} \,,\; u \in \overset{\circ}{W}{}^1_p(\Omega) \,.$$

   What does the constant c depend on? Is the boundedness assumption really necessary?

2. Let $\Omega \subset \mathbb{R}^n$ and $p \in (1, \infty)$ and define

$$W^m_p(\Omega) = \left\{ u \in \mathcal{D}'(\Omega) \,\middle|\, \partial^\alpha u \in L_p(\Omega) \,,\; |\alpha| \leq m \right\} \,.$$

   Show that $W^m_p(\Omega)$ is a Banach space if endowed with the norm $\|\cdot\|_{m,p}$ defined by

$$\|u\|_{m,p} = \Big(\sum_{|\alpha| \leq m} \|\partial^\alpha u\|^p_{L_p(\Omega)} \Big)^{1/p} \,,\; u \in W^m_p(\Omega) \,.$$

   Prove that $W^1_p(0,1) \hookrightarrow BUC^{1-1/p}([0,1])$.
   [Hint: Use the fact that $C^1([0,1])$ is dense in $W^1_p(0,1)$]

3. Prove that $\mathcal{S}(\mathbb{R}^n)$ is dense in $H^s(\mathbb{R}^n)$ for $s \in \mathbb{R}$.

4. Let $\Omega = \mathbb{B}(0, 1/2)$ and the function u be defined through

$$u(x,y) = \log\big(\log(\frac{2}{\sqrt{x^2+y^2}})\big) \,,\; (x,y) \in \Omega \,.$$

   Then u is obviously not continuous in $(x,y) = (0,0)$. Prove that, however, $u \in H^1(\Omega)$. Let now

$$u(x,y) = xy \big[\log\big|\log|(x,y)|\big| - \log\log 2\big] \,,\; (x,y) \in \Omega.$$

   Then

$$u \in C^1(\bar{\Omega}) \text{ and } \partial^2_j u \in C(\bar{\Omega}) \,,\; j = 1, 2$$

   or $u \notin C^2(\bar{\Omega})$, that is, u is a solution of the Dirichlet problem in Ω for a continuous datum but is not twice continuously differentiable.

5. Let E be a Banach space and $A : \mathrm{dom}(A) \subset E \longrightarrow E$ a linear, possibly unbounded, operator on E. A is said to be invertible if there exists a bounded operator $B \in \mathcal{L}(E)$ such that

$$AB = \mathrm{id}_E \text{ and } BA = \mathrm{id}_{\mathrm{dom}(A)} \,.$$

   Such an operator A can fail to be invertible either because it has non trivial kernel (not injective)

$$\ker(A) \neq \{0\}$$

or because it is not surjective

$$\overline{R(A)} \neq E$$

but, also, because its "inverse" is unbounded.
Let

$$E = l_2(\mathbb{N}) := \big\{ (x_j)_{j \in \mathbb{N}} \,|\, x_j \in \mathbb{R} \,\forall j \in \mathbb{N} \text{ and } \sum_{j=1}^{\infty} x_j^2 < \infty \big\}$$

with the norm naturally induced by the scalar product

$$(x|y) = \sum_{j=1}^{\infty} x_j\, y_j \,, \ x, y \in l_2(\mathbb{N}) \,.$$

For each one of the ways described find an operator A on $l_2(\mathbb{N})$ which fails to be invertible in that way. In general the set

$$\sigma(A) = \{ \lambda \in \mathbb{C} \,|\, \lambda - A \text{ is not invertible} \} \subset \mathbb{C}$$

is called spectrum of A. Show that it is a closed set.
